Reg-Gate

Reg-Gate pauses tokenized assets when U.S. regulators act.

A Chainlink CRE workflow reads the Federal Register, writes a status for each asset category on-chain, and token contracts check it before every transfer. Every block waits for a named person to review it.

Exhibit 1. The live contract on Ethereum Sepolia, read by the status page. Three categories are under review; the strict demo token gAST cannot move. Times are US Eastern.

Built by Brian Araujo, NorthSchema

Entry to BLI Legal Tech Hackathon 2 and the Chainlink CRE bounty, October 2026.

Between October 6 and 19, three federal agencies published actions on crypto assets. Tokenized assets kept trading through all of them.

Published	Agency	Document	What it is
Oct 6, 2026	SEC	2026-20466	Proposed custody rules for advisers and funds, including crypto custody
Oct 9, 2026	NCUA	2026-20729	Notice of proposed Call Report changes covering credit unions' payment stablecoin activity
Oct 13, 2026	CFTC	2026-20888	Proposed Regulation Crypto Asset Transactions and Regulation Crypto Asset Markets

Today, the only link between documents like these and a token contract is a person who reads the news and tells an engineer.

One document, followed from the Federal Register to a blocked transfer.

October 13

The CFTC publishes a proposed rule.

```
2026-20888
Regulation Crypto Asset Transactions and Regulation Crypto Asset Markets
Proposed Rule
```

October 20

The CRE workflow fetches it, classifies it, and the nodes agree.

```
window
2026-10-06..2026-10-19
DIGITAL_ASSET_MARKETS
=REVIEW (2026-20888)
```

October 20

A signed report is written to Ethereum Sepolia and Base Sepolia.

```
tx 0xcd60750d…4fac4
forwarder result true
event StatusUpdated
```

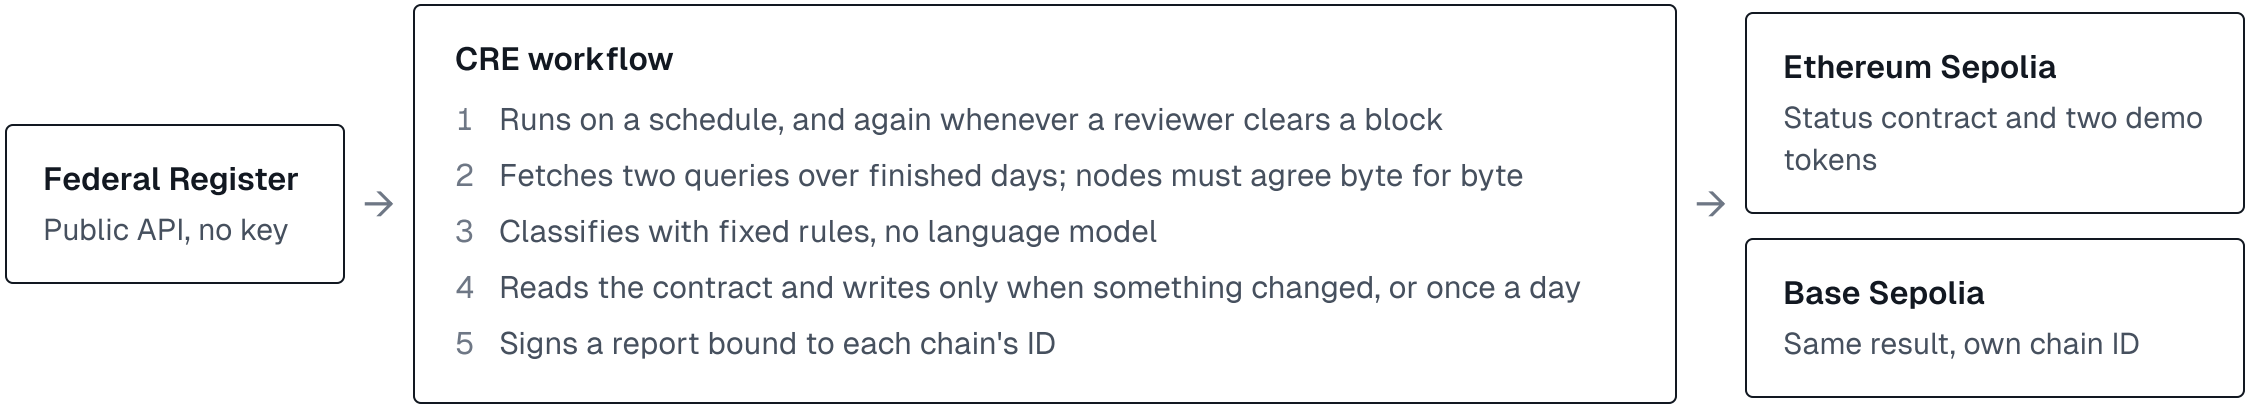

From then on

The strict token refuses to move.

```
eth_call from the status page
gAST.transfer(…, 100 gAST)
reverts
TransferBlockedByRegGate(2, REVIEW)
```

Exhibit 1 on the cover shows the same revert, read live. A proposal puts the category at REVIEW. The issuer chooses how its token reacts: a strict token pauses at REVIEW, a lenient one keeps moving until a rule is actually in force.

Chainlink CRE runs every step, and anything that goes wrong ends in BLOCK.

If this happens	The contract shows
The API is down, returns bad data, or nodes disagree	Nothing is written. After 7 days of silence, BLOCK.
A document type the rules do not recognize	BLOCK
More results than one page holds	BLOCK in every category
A report replayed, out of order, or meant for the other chain	Rejected

A block holds until a named reviewer clears that exact document.

1. Each report lists every blocking document, not only the newest.
   One document per category would let a second one slip through.
2. The category stays at BLOCK, even if later reports say OK.
   A quiet day cannot unlock it.
3. The reviewer calls clearLatch with the category and the document number.
   Naming the wrong document is rejected.
4. The workflow re-checks the Federal Register immediately.
   The next unreviewed document latches. When none are left, the category reads REVIEW, never OK.

What the chain records

```
LatchCleared(category, documentNumber, by)
```

Each clear is a public event: which category, which federal document, which reviewer's address, and the block time.

That is the audit trail a compliance team needs, written by the same system that enforces the block.

Anyone can check this without taking our word for it.

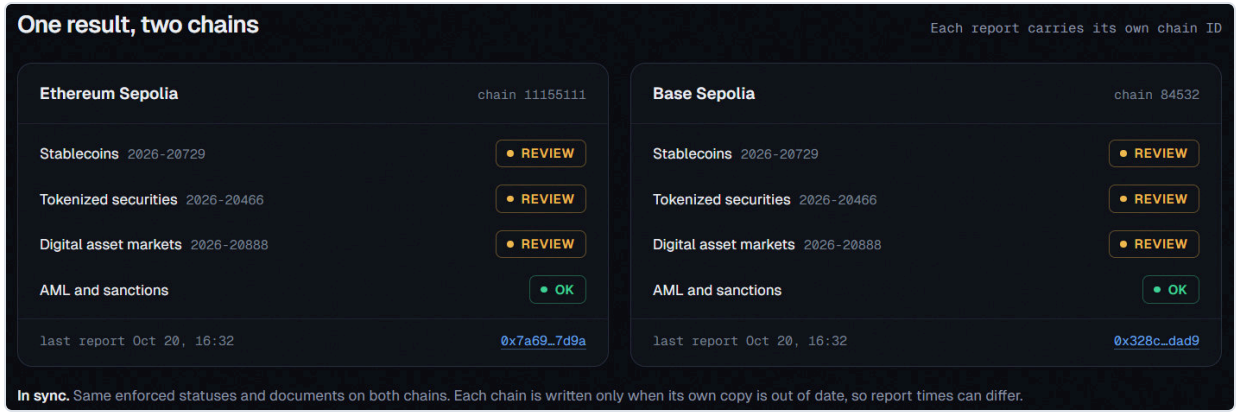

Exhibit 2. The same report on both chains, read live by the status page. Times are US Eastern.

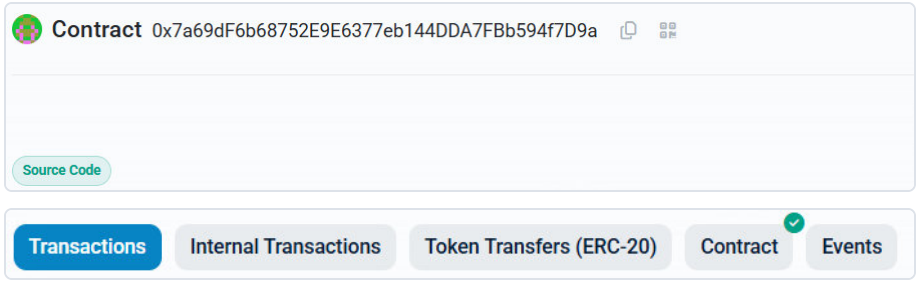

Exhibit 3. Two parts of the status contract's Etherscan page. The Source Code label and the check on the Contract tab mean the code is verified.

171 automated tests and 72 planted bugs, all caught. A planted bug breaks one line of production code on purpose, such as removing the forwarder check, and a test has to fail. All four contracts are source-verified on Etherscan and Basescan.

Test mode, stated plainly. The workflow runs in Chainlink's CRE simulator and writes real testnet transactions through Chainlink's simulation forwarder. The production path, with the real forwarder and a pinned workflow owner, is already in the contract.

Who it is for, and what comes next.

Who it is for

Issuers of tokenized funds, stablecoins and tokenized securities, who want trading to pause when the law in their category moves.

Compliance teams and transfer agents, who need a record of who reviewed which federal document, and when.

Venues that accept tokenized collateral and would rather gate by category than maintain allowlists.

What comes next

Deploy the workflow to a live Chainlink network with the production forwarder and a multisig reviewer.

Add more official sources: SEC releases, OFAC list updates and the EU Official Journal.

Charge per production gate, priced by category, with custom watchlists as a paid tier.
