Reg-Gate

A compliance circuit breaker for tokenized assets.

A Chainlink CRE workflow reads the U.S. Federal Register, classifies new federal actions into four asset categories, and writes a fail-closed status on-chain. Tokens check it before every transfer. Every block needs a named human review, recorded on-chain.

REGGATESTATUS, LIVE — REPORT OF OCT 20, 2026

Stablecoins
NCUA notice, 2026-20729 — REVIEW

Tokenized securities
SEC proposed rule, 2026-20466 — REVIEW

Digital asset markets
CFTC proposed rule, 2026-20888 — REVIEW

AML and sanctions
No obligation-adding documents — OK

gUSD	gAST
Lenient, transfers open	Strict, transfers paused

Regulation reaches tokens late, and only through people.

When a regulator acts on stablecoins, tokenized securities, or crypto markets, the token has no way to know. It keeps settling transfers while the issuer finds out from the news and an engineer updates the contract by hand.

THE ASSET

Moves around the clock

Tokenized funds, stablecoins and tokenized securities settle 24 hours a day, every day, with no compliance pause built in.

THE LAW

Changes in the Federal Register

Every proposed rule, final rule and presidential action is published there each business day, by the SEC, CFTC, Treasury, NCUA and others.

THE GAP

Nothing connects the two

Today the link is a person reading the news and emailing engineers, or an off-chain alert that never reaches the contract.

REG-GATE'S ANSWER

Turn the official record into an on-chain signal the token acts on, with a human sign-off for anything that blocks, and fail safe when anything is uncertain.

Three statuses, four categories, one rule: when in doubt, block.

STATUS	SET WHEN	STRICT TOKEN	LENIENT TOKEN
OK	No new federal action in the category	Moves	Moves
REVIEW	A proposal, a notice, or a final rule not yet in effect	Pauses	Moves
BLOCK	A final rule in effect, a presidential action, an unknown type, or no fresh report for 7 days	Pauses	Pauses

Categories: Stablecoins, Tokenized securities, Digital asset markets, AML and sanctions.
Watched regulators: SEC, CFTC, Treasury, OCC, FDIC, Federal Reserve, FinCEN, OFAC, CFPB, IRS, NCUA, Executive Office of the President.

A circuit breaker the issuer configures

Each token picks one category and a mode. Strict pauses during any open rulemaking. Lenient pauses only when a rule is in force.

A public review record

A block stays latched until a named reviewer clears it, document by document. Each clear is a timestamped on-chain event.

Fail-closed by construction

Outage, bad data, disagreement between nodes, or silence past the time limit all read as BLOCK. Never as OK.

CRE is the orchestration layer, from source to settlement.

SOURCE

U.S. Federal Register

Official public API, no key. Two queries over finished days: documents published in the last 14 days, and final rules taking effect up to a year ahead.

→

CHAINLINK CRE WORKFLOW

Fetch, agree, decide, write

TRIGGERS
Cron heartbeat, plus an EVM log trigger on reviewer clears

HTTP + CONSENSUS
Nodes must return byte-identical results

CLASSIFY
Deterministic rules, no LLM in the decision path

READ BEFORE WRITE
Contract state at latest and finalized blocks

DON TIME
Reports stamped with consensus time

REPORT + WRITE
Signed report bound to each chain's ID

→

ETHEREUM SEPOLIA

RegGateStatus + GatedTokens

Receiver contract, replay guards, per-document review. Two demo tokens check it on every transfer.

BASE SEPOLIA

RegGateStatus

The same agreed result, bound to its own chain ID, with its own write decision.

Review loop A reviewer's clear emits `LatchCleared` on either chain, and the log trigger re-runs the full check immediately.

Every capability has a job, and every job is tested.

CAPABILITY	WHAT IT DOES IN REG-GATE	WHY IT MATTERS
Cron trigger	The heartbeat that runs the full check on a schedule	A fresh report at least daily keeps the contract from going stale
EVM log trigger	Re-runs the check when a reviewer clears a block, on either chain, at the safe head	A clear is judged against current law, not yesterday's report
HTTP + identical consensus	Both Federal Register queries; nodes must agree byte for byte	One faulty node or API response cannot set a status
DON time	`runtime.now()` stamps every report	No node clock can push a report into the future
EVM read	`snapshot()` at the latest and finalized blocks before writing	Skips writes that change nothing; any doubt means write
Report + EVM write	Signed report to Ethereum Sepolia and Base Sepolia, chain ID in the payload	A report for one chain cannot be replayed on the other
SDK test mocks	Both trigger handlers run end to end against the official CRE SDK mocks	The wiring is tested, not only the parts

The system flags. A person decides. The chain keeps the record.

1

A blocking document arrives

The report lists every document at BLOCK, not only the newest. Each one latches its category.

2

Latched until reviewed

The category stays BLOCK through later OK reports. Silence or a quiet day cannot unlock it.

3

A reviewer clears one document

The reviewer names the exact document number. A mismatch is rejected. The clear is a timestamped event.

4

Immediate re-check

The clear triggers the workflow at once. The next unreviewed document latches. When all are reviewed, BLOCK reads REVIEW, never OK.

THE ON-CHAIN RECORD

`clearLatch(category, document) → LatchCleared(category, document, reviewer)`

One call per reviewed document. The event names the category, the federal document number, and the reviewer's address, with the block's timestamp.

Why compliance teams want this

An auditable answer to "who reviewed which federal document, and when," written by the system that enforces it, not reconstructed later from email.

Why it is safe by default

Only the configured reviewer can clear, only one document at a time, and nothing a reviewer does can produce OK while a document in the window still blocks.

06 LIVE ON TESTNET

Real federal documents, real transactions, a live page.

FIRST V2 REPORT, OCT 20, 2026, PUBLICATIONS OCT 6 TO OCT 19

CATEGORY	STATUS	DOCUMENT BEHIND IT
Stablecoins	REVIEW	NCUA notice of proposed Call Report changes on payment stablecoin activity 2026-20729
Tokenized securities	REVIEW	SEC proposed crypto custody rules 2026-20466
Digital asset markets	REVIEW	CFTC Regulation Crypto Asset Transactions and Markets 2026-20888
AML and sanctions	OK	Two FinCEN withdrawals, which remove obligations

CONTRACTS, ALL SOURCE-VERIFIED

RegGateStatus, Sepolia `0x7a69df6b…f7d9a`

RegGateStatus, Base Sepolia `0x328c1c98…9dad9`

gUSD, lenient `0xc2bb916e…9df7b`

gAST, strict `0xc3aedef6…29cda`

ACCEPTED REPORTS

Sepolia `0xcd60750d…e7ad4fac4`

Built to fail closed, and proven with tests that try to break it.

171
automated tests: 120 workflow, 51 contract

72/72
planted bugs caught, each a line of code broken on purpose

4/4
contracts source-verified on Etherscan and Basescan

2
chains written from one agreed result

CONTRACT GUARDS

- **Forwarder only,** for its own chain ID, with strictly increasing timestamps
- **Replay and future reports rejected,** at most 2 minutes ahead of the chain
- **Malformed reports rejected,** exact length, consistent lists
- **Two-step ownership,** and a pinned workflow owner that cannot be unset

TEST MODE TODAY, PRODUCTION PATH BUILT

- **Today:** runs in the CRE simulator through Chainlink's testnet forwarder, declared on-chain
- **Production mode is in the contract:** real forwarder, pinned workflow owner, and it refuses to deploy without one
- **Status page shows UNKNOWN,** never OK, when it cannot read the chain
- **No secrets in the workflow:** the data source is public

Built for issuers, compliance teams and protocols.

ISSUERS

Tokenized funds, stablecoins, securities

A circuit breaker tied to the official record, so a token does not trade straight through a rule change.

COMPLIANCE TEAMS

Transfer agents, counsel, risk

A triage feed with a built-in audit trail. Every status change and every human sign-off is on-chain.

PROTOCOLS

Venues accepting tokenized collateral

Gate acceptance per regulatory category instead of maintaining hard-coded allowlists.

BUSINESS MODEL

- **Subscription per production gate,** priced by category
- **Paid tiers** for custom watchlists by agency, CFR part, or keyword, and private reviewer workflows

ROADMAP

- **Live DON deployment** with the production forwarder and a multisig reviewer
- **More official sources:** SEC releases, OFAC list updates, the EU Official Journal
